PROFILE

Software engineer with 3+ years' experience building and supporting production software across frontend, backend and data systems. I've worked on internal business systems, customer-facing products and high-volume data processing, with increasing responsibility for turning operational requirements into software, investigating production issues and taking changes through to release.

EXPERIENCE

Direct Business Group · Business energy & utilities consultancy

Full-Stack Software Engineer

Jan 2024 - Present

ENERGY DATA PLATFORM

- **Developed and extended a centralised energy-data platform** ingesting and processing millions of electricity and gas consumption readings from multiple external providers, supporting reporting, downstream integrations and derived consumption data.
- **Investigated stakeholder-reported discrepancies** between expected and raw consumption data, translating energy-domain rules into fixes across electricity, gas and calculated streams. Implemented time-series storage, cumulative-to-interval processing, derived-stream calculations and batched database writes for large-scale ingestion.

SALES ADMINISTRATION PLATFORM

- **Implemented a new internal sales administration platform** from initial setup through MVP, bringing post-sale operations into a dedicated application while integrating with existing backend systems and shared sales data.
- **Unified standard and alternative sale types** held in different underlying systems into a common administrative workflow, building functionality for sale changes, meter management, tasks, documents, complaints, commissions and automated supplier and customer communications. Continued extending and supporting the platform after launch.

CORE CRM

- **Built and extended lead, pipeline and sales-progression functionality** within the company's primary CRM, supporting the lead-to-sale process for ~200 staff across sales, compliance, finance and administration, with integrations into customer-facing and internal systems.

Junior Software Developer

Jul 2023 - Jan 2024

CUSTOMER PORTAL

- **Built frontend and backend functionality** for a live customer portal giving business energy customers self-service access to account progress, meters, documents and consumption insights, including meter lookup, authenticated integrations, consumption analysis, responsive UI development and automated testing.

TECHNICAL SKILLS

Languages

TypeScript
JavaScript
SQL

Frontend

Vue 3 · React
Nuxt · Next.js
Tailwind CSS

Backend & Data

Node.js · AdonisJS
Express · PostgreSQL
TimescaleDB · REST APIs
GraphQL · WebSockets

Engineering

Git · Docker
GitHub Actions · Vitest
Cypress · Database migrations
Microsoft/Azure authentication
Third-party API integrations

EDUCATION

BSc Web Development

First Class Honours

Falmouth University
2020 - 2023
