PROFILE

Software engineer with 3+ years' experience building and supporting production software across frontend, backend and data systems. Experienced in taking operational requirements from stakeholder discussions through design, implementation, release and production support, with ownership of internal business applications and energy-data processing systems.

EXPERIENCE

Direct Global · Business energy & utilities consultancy

Full-Stack Software Engineer

Jan 2024 - Present

ENERGY DATA PLATFORM

- **Own the ongoing development and technical delivery** of a centralised energy-data platform serving ~50 customers across 400-500+ meters and devices, storing and processing millions of electricity and gas consumption readings from Xoserve, Electralink, TTI and other external sources.
- **Work directly with stakeholders to investigate production-data discrepancies** and establish expected domain behaviour, then scope and deliver fixes across electricity, gas and calculated streams. Implemented time-series storage, cumulative-to-interval processing, derived metric and virtual streams, scheduled processing and batched database writes for large-scale ingestion.

SALES ADMINISTRATION PLATFORM

- **Built and delivered an internal sales administration platform** from initial application setup through MVP, separating post-sale operations from the company's primary CRM and providing a dedicated workflow for around 50 staff across finance, compliance and administration.
- **Unified standard and alternative sale types** held across different underlying systems into a common administrative workflow, integrating with existing backend systems and shared sales data. Built functionality for sale changes, meter management, tasks, documents, complaints, commissions and automated supplier and customer communications, and continued extending and supporting the platform after launch.

SALES CRM

- **Built and extended lead, pipeline and sales-progression functionality** within the company's primary CRM, supporting the lead-to-sale process for ~200 staff across sales, compliance, finance and administration, with integrations into customer-facing and internal systems.

Junior Software Developer

Jul 2023 - Jan 2024

CUSTOMER PORTAL

- **Built full-stack functionality for a live customer portal** giving business energy customers self-service access to account progress, meters, documents and consumption insights. Developed meter lookup and onboarding workflows across frontend and backend services, authenticated integrations, consumption-analysis functionality, responsive interfaces and automated tests.

TECHNICAL SKILLS

Languages

TypeScript
JavaScript
SQL

Frontend

Vue 3 · React
Nuxt · Next.js
Tailwind CSS

Backend & Data

Node.js · AdonisJS
Express · PostgreSQL
TimescaleDB · REST APIs
GraphQL · WebSockets

Engineering

Git · Docker
GitHub Actions · Vitest
Cypress · Database migrations
Microsoft authentication (MSAL)
Third-party API integrations

EDUCATION

BSc Web Development

First Class Honours

Falmouth University
2020 - 2023
